Host Module

Module Permission According to Roles (Sysadmin, Administrator and Assistant)

Module	Create	Edit	Show	Role
Host	YES	YES	YES	Sysadmin
	YES	YES	YES	Administrator
	NO	NO	YES	Assistant

Module Overview

If you want to restrict user access to certain locations you have to define one or more hosts for your location. Thus not only the normal user credentials (username / password) will be checked, but also from where the user tries to connect. This is handled by a NAS identifier of your choice.

- By selecting any of the hosts (First column of the Table), you can edit the host ([Create/Edit Host](#)).
- By selecting the **New Host** (First link of top right corner), you can create a new host ([Create/Edit Host](#)) for that location.
- By selecting the **Location Overview** (Second link of top right corner), you can see your all locations, cities, license and hosts information ([Location Module](#)).
