Create/Edit Location

Module Description

Location Screen

You can create and edit a location,

- By selecting the **Show host** (Link of the top right corner), you can see all of your hosts of the corresponding location ([Host Module](#)).

Fields

General

Address of your available hotspot location.

Contact Person

Primary contact of your company / organization who will be responsible for your frontend of hotspot solution of a specific location.

Walled Garden

If you want to provide features other than the default Gateway / Router login pages you can use the Walled Garden Options. One reason is that you want your hotspot users to be able to create their own tickets to gain Internet access. Another reason can be that you want your users to be re-authenticated after their first login, i.e. when they come back they don't have to enter their credentials a second time, but will be connected to the Internet right away. Furthermore via walled

garden there are more options for a custom layout than with the router custom layout features.

The walled garden options must match the router configuration and vice versa. For details please read [Walled Garden Options](#).

Disabled

This is the standard configuration: no external captive portal enabled.
