# Voucher Module

## Module Permission According to Roles (Sysadmin, Administrator and Assistant)

Module	Create	Edit	Show	Role
Voucher	YES	NO	YES	Sysadmin
	YES	NO	YES	Administrator
	YES	NO	YES	Assistant

## Module Overview

Vouchers are used to allow access to the Internet without asking personal information, i.e. a combination of username / password without knowing the actual user's name, address etc. There is also the advantage that more than 1 voucher can be created at one time. You may give a number up to 99 vouchers to be created in a time.

You may choose different options to display existing vouchers, you can use different filtering options such as **Type**, **Tariff**, **Location** and **Host**.

Vouchers can't be edited afterwards.  
If you delete vouchers, all the accounts which are belong to these vouchers, will be deleted after 10 minutes.

- The client can search vouchers based on *Type*, *Tariff*, *Location* and *Host*.

- CSV list can be downloaded to get the access data (First icon in the last column). You can import this CSV file into different applications such as excel.
- Voucher can be deleted using the second icon in the last column.
